Overview

I. Objectives of the presentation

II. Main characteristics of Latin American inequality.

III. The role of tax policy on income distribution.

IV. Conclusions and future challenges.
Main characteristics of Latin American inequality

- High Concentration
Latin America is singled out due to its high income inequality

Fragmented societies in which a large fraction of total income is captured by the richest 10%
Main characteristics of Latin American inequality

- High Concentration
- Geographical inequality
There are high income gaps between regions within the same country.

The role of tax policy in the distribution of income

Tax policy can impact equality in two ways:

- By financing public spending, it can contribute to the formation of human capital and improve market income.

- Through progressive taxes, it can modify the distribution of income after taxes. Income and property taxes play a key role in this regard.
Fiscal policy in Latin America is not performing its redistributive function properly.

What bounds the redistributive role of tax policy in Latin America?

- Low and volatile tax burden

  The region’s potential tax burden is significantly higher than its effective one.

  Resources for social spending could be increased.
Historically, tax burden in Latin America has been low despite high government financing needs.

(Percentage of GDP, simple average)

Average tax burden in Latin America is half than that of the OECD

The region’s low tax burden is primarily a result of low direct tax collection (income and property taxes).
Tax burden in Latin American countries is undersized relative to their own level of development.

In addition, macroeconomic volatility causes a greater volatility in tax income

This increases government financing needs and limits its capacity to invest in social programs.
High correlation between fiscal revenues and export prices

What bounds the redistributive role of tax policy in Latin America?

- Low and volatile tax burden

- Regressive tax structure

The main cause of the gap between potential and effective revenue is a shortfall in direct taxation, specifically, in personal income tax.
Tax structures in Latin America are characterized by:

- Low income tax revenues.
  - Focused on corporations.
- Personal income tax is mainly a tax on income from waged employment.
- Insignificant property taxes.
- Preeminence in general taxes on consumption (VAT-type taxes).
  - It is government’s primary source of revenue.
- High importance of fiscal revenues originated in NNRR.
Strengthening of property taxes is a challenge, particularly for subnational governments.

Property taxes should be strengthened at the subnational level. In order to do it, cadastral records should be improved.

Low compliance and high evasion level undermine the stability and legitimacy of tax systems

- Neither the level of revenue nor the tax structure is sustainable with a poor degree of compliance.
  - Tax evasion and avoidance limits resources for social spending.
  - These practices are among the principal causes of inequity. They violate both:
    - Horizontal equity: people with a similar ability to pay taxes do not pay the same or similar amounts
    - Vertical equity: people with a greater ability to pay taxes do not pay more
Conclusions and future challenges

- In Latin America taxation has not been a good distributive policy tool.
- The region’s potential tax burden is significantly higher than its effective one.
- Tax structure in Latin-American countries is skewed toward indirect taxation.
- There is a shortfall in direct taxation, specifically, in personal income tax.
- In several countries, the importance of NNRR tax base has weakened the tax system.
Conclusions and future challenges

- All these characteristics have weakened the multiple dimensions of equity
- The challenge: there is some role for fiscal policy in general and tax policy in particular to improve...
  - Vertical equity
  - Horizontal equity
  - Regional equity
  - Intergenerational equity
Thank you!

Thus, governments in Latin America do not necessarily provide a buffer against adverse shocks.

The high degree of economic volatility is closely related to external shocks, such as reversals in capital flows or terms of trade.
Tax structure is heavily skewed towards indirect taxation.
Increased tax burden may improve equality through a higher level of tax revenues invested in social programs.

Note: (*) In these countries government coverage is broader because it incorporates public companies.
Income tax revenue is primarily from income earned by corporations.

Mostly income from corporations engaged in the exploitation of non-renewable resources.

Note: “Non classifiable” corresponds to data where official figures do not make a difference between persons and companies.
Why are direct taxes absent from the picture?

- Low median income & poor income distribution
- Prominent levels of informality
- Poor tax compliance
- The wide use of tax incentives
- Employee compensation accounts for a small share of GDP
- Tax policy design that favors economic neutrality and efficiency
- Weak tax authorities
- Political obstacles
Conclusions and future challenges

- Thus, direct taxation must be strengthened, specially, personal income tax base should be expanded.

- This requires:
  - Broadening the bases of direct taxes.
  - Limiting the use of tax incentives.
  - Curbing tax evasion and avoidance.
  - Strengthening property taxes, mainly at the subnational level.
