Water Issues in the Coal Supply Chain in China

(July 25th, 2012, San Francisco)

Dr. Pei Liu

Department of Thermal Engineering
Tsinghua University

Outline

- Coal and water resources in China
- Existing problems in the coal/water nexus
- Challenges for the future development
- Way out: technical and policy approaches

Primary Energy Consumption of China, 1991-2008

China Energy Mix 2008

Chinese CO₂ emission / Mt / a

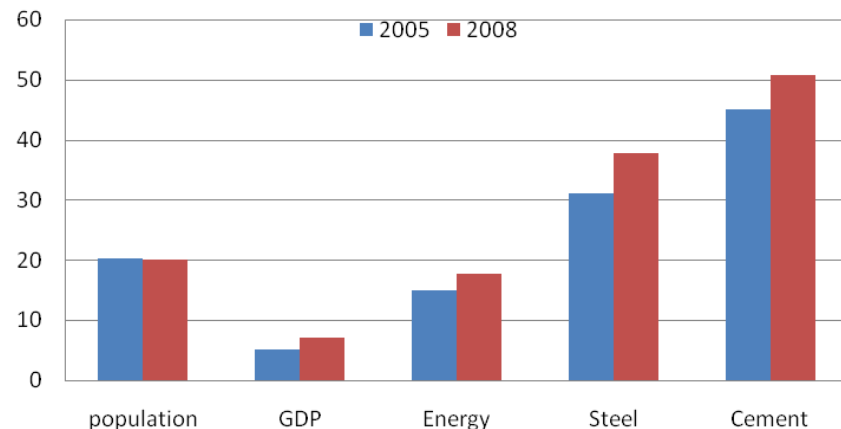

Urbanization Remains a Big Driver for Energy Demand

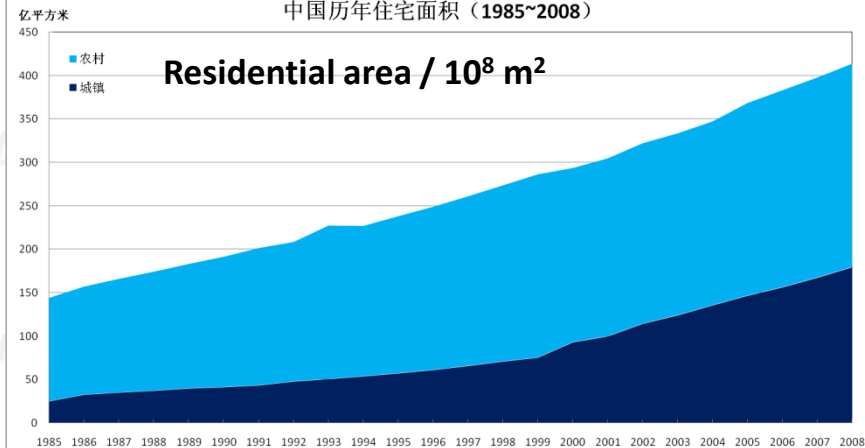

中国1949-2009年的城镇化水平 (%)
Urbanization Process in China between 1949-2009

Chinese important indicators (% of world total)

中国历年住宅面积 (1985~2008)

中国历年人均住宅面积 (1985~2008)

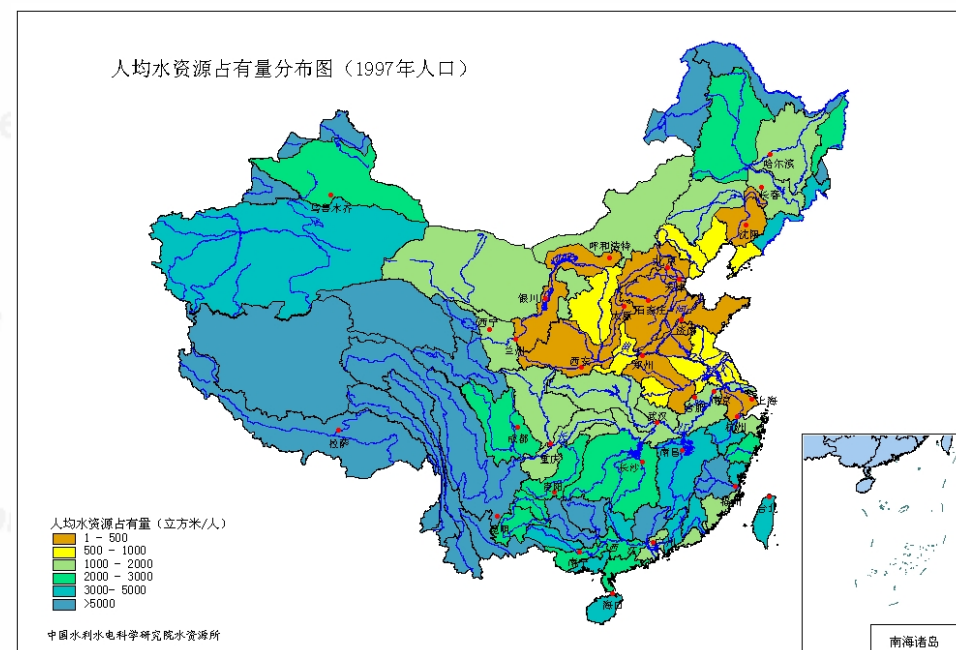

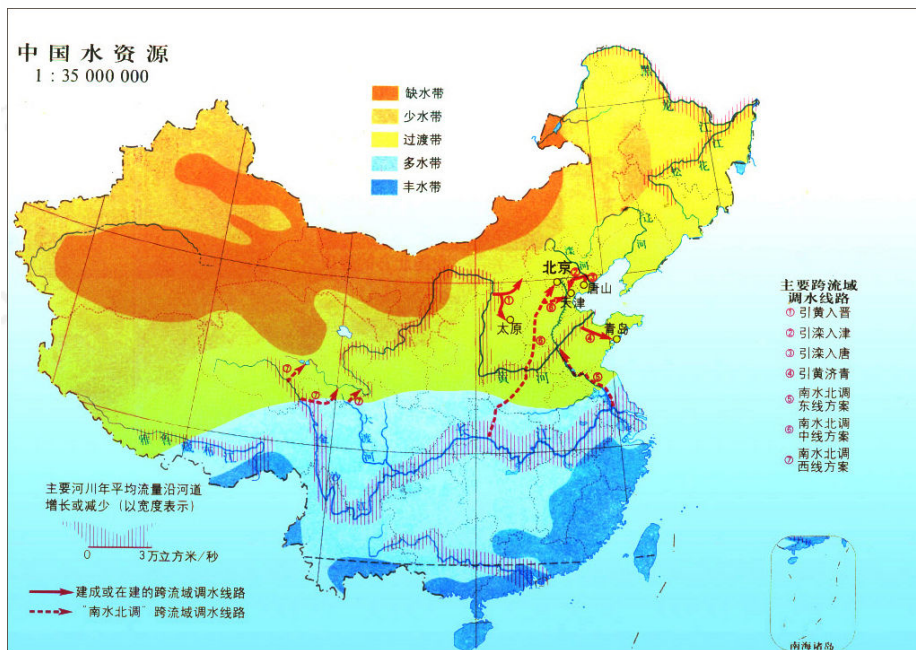

A View of Shanghai in the Future

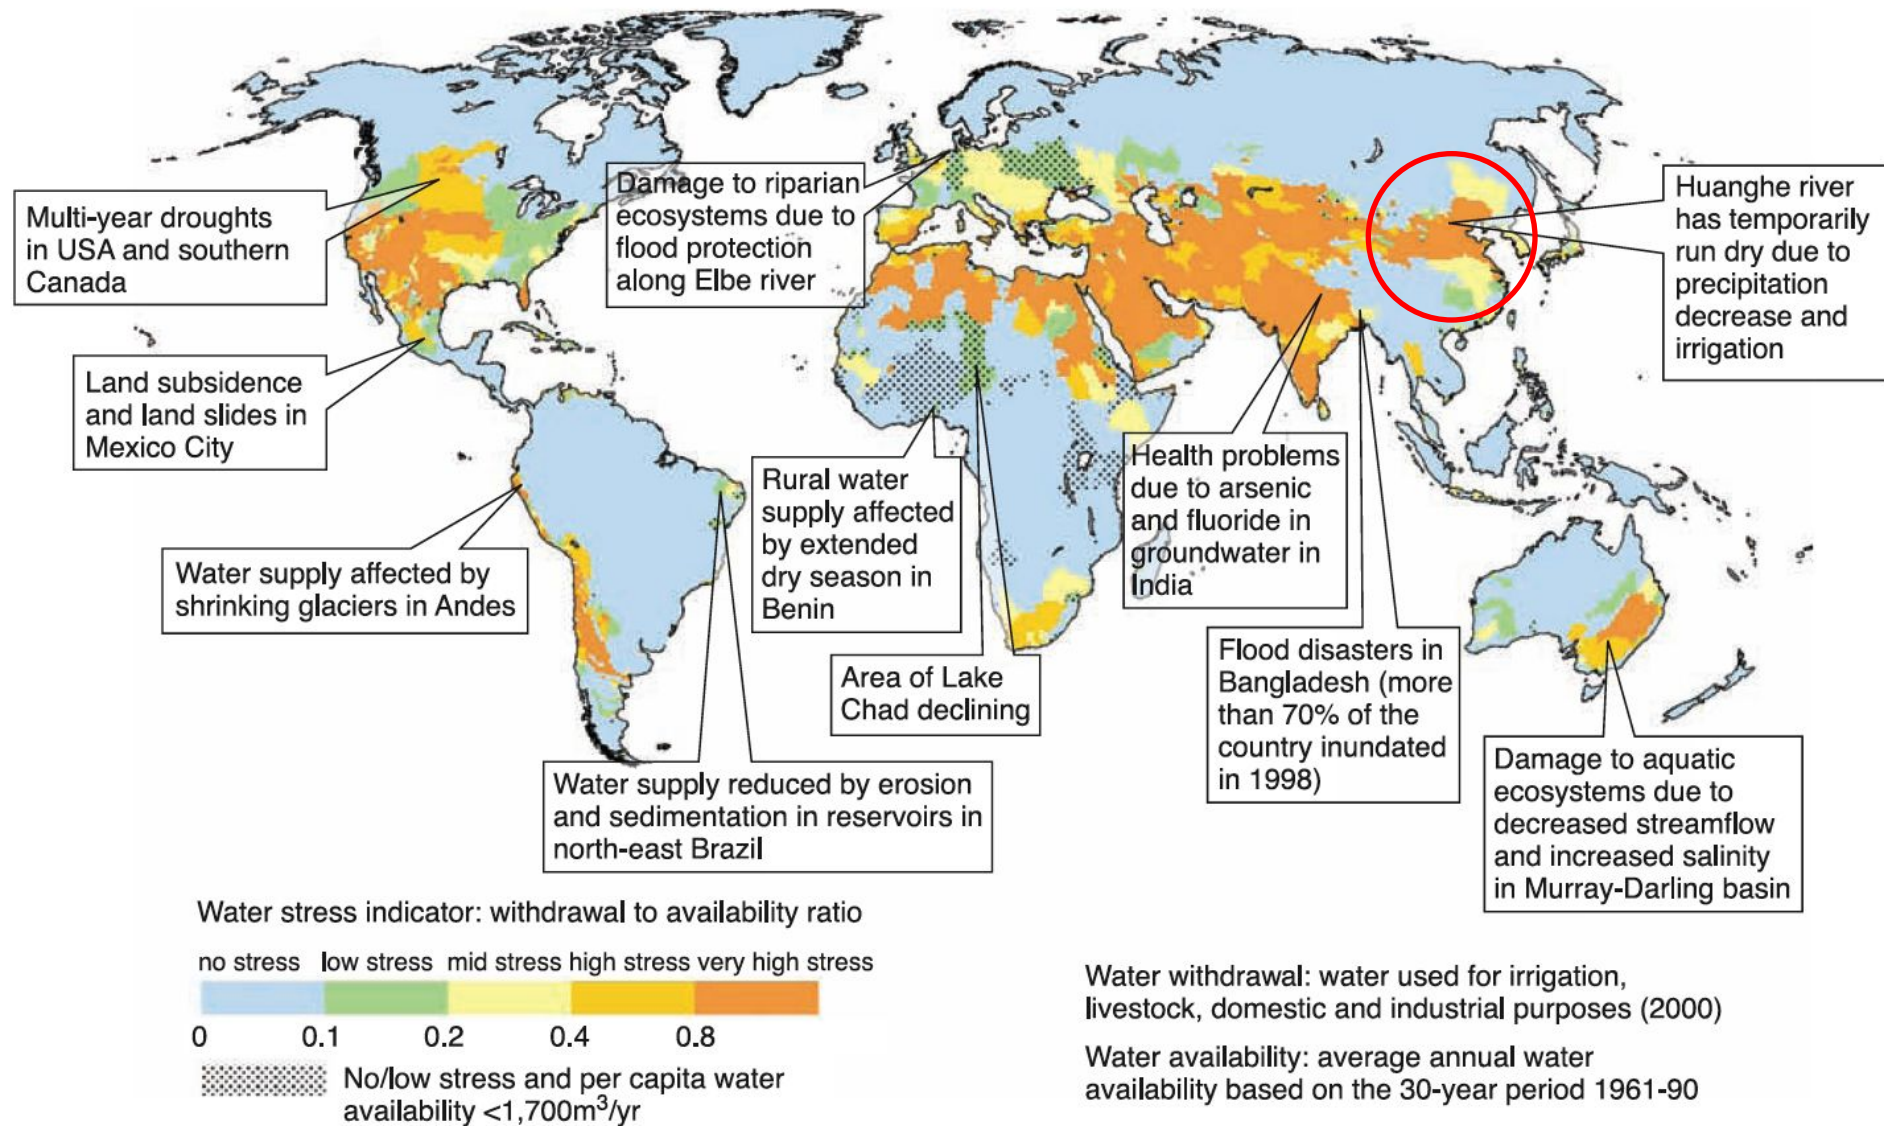

From Shanghai Urban Planning Exhibition

Statistics of Water Resources in China

- Abundant in total, scarce on a per capita basis
 - Total amount in 2008: **2,743bm³**, **No.6 in the world** after Brazil, Russia, Canada, the United States and Indonesia.
 - **2071m³ per capita in 2008**, 1/16 of Brazilian, 1/10 of Russian, **¼ of world average**, ranking after 110, one of the 13 water-scarce countries.
 - **Less than 600 m³ per capita** of available water resources, deducting flood and heavily polluted water.
- Abundant in the south, scarce in the north

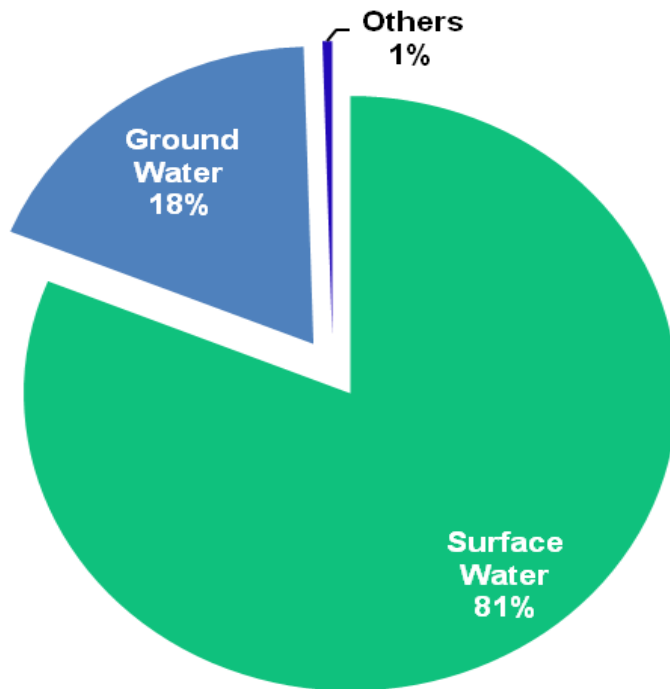

Global and China's Water Stress

Water Supply and Withdrawal in China

Water Supply in China, 2008

Water Withdrawal in China, 2008

China's total water withdrawal in 2008 was 591 billion cubic meters, and per capita withdrawal was **446** cubic meters, below the global average of **576** cubic meters!

Water Withdrawal and Waste Water Discharge in Energy Related Sectors

Water Withdrawal in Energy Related Industrial
Sectors (2002 data)

能源相关部门取水量 (2002年数据)

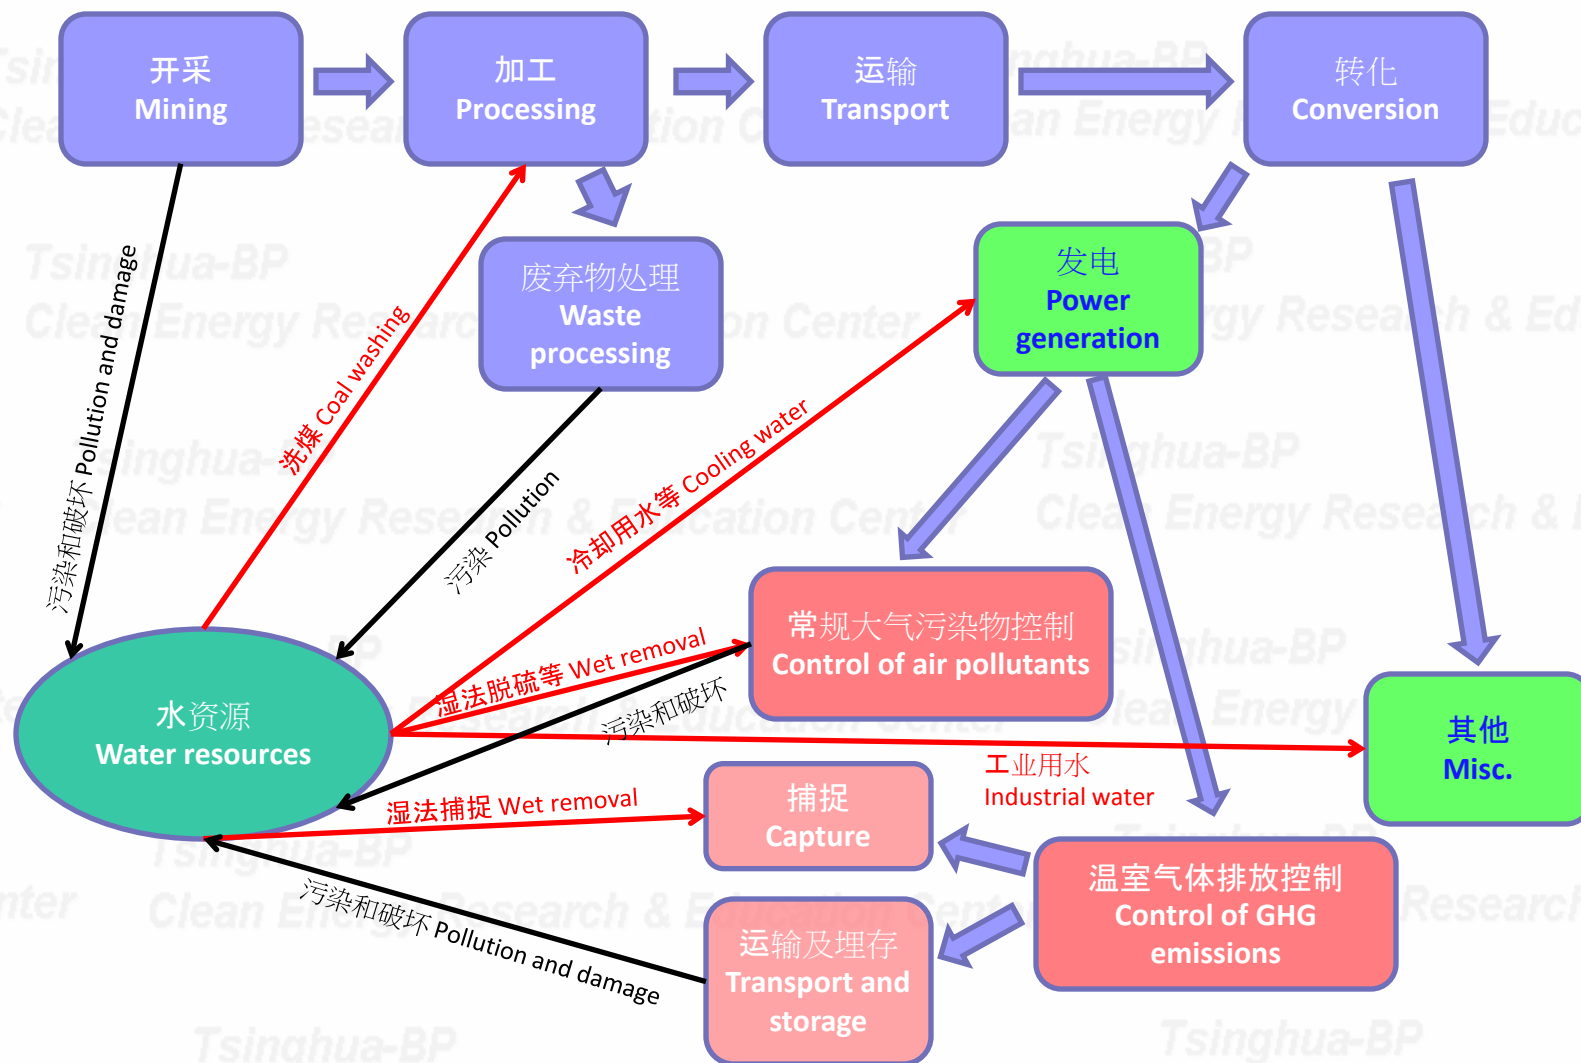

Discharge and Treatment of Waste Water in Energy Related Sectors (2008 data)

能源相关部门工业废水处理排放量 (2008 data)

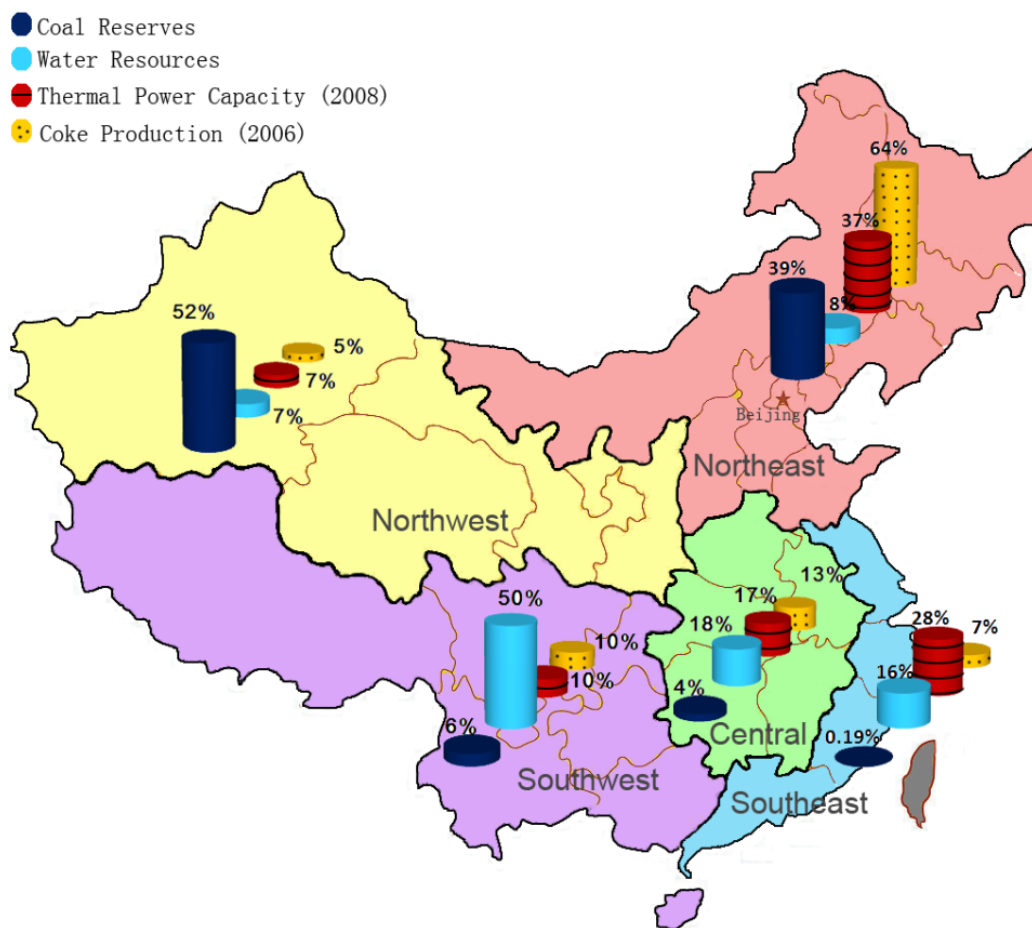

Energy sectors are huge consumers of water resources, but not that dirty!

Energy and Water Nexus in Coal Supply Chain

Problem 1

Uneven Distribution of Water, Coal, and Energy Demand

Coal Reserves, water resources and coal industry distribution in China

Problem 2

Inefficient Utilization of Water Resources in Coal Mining

- China has approximately 15,000 coal mines with the total productivity of 3.69 billion tonnes
 - **70 percent** of China's coal mines are located in **water-scare regions**
 - **40 percent** of them have severe problems of **water shortage**
- Environmental impacts caused by water withdrawal and drainage in coal mining
 - Damage to underground water:
1.07 m³/t (Shanxi average)
 - Groundwater level descending
 - Soil salinization
 - Land desertification

Problem 2 (Continued)

Inefficient Utilization of Water Resources in Coal Mining

■ Pollution

- Waste water drainage: **$\sim 4 \text{ m}^3/\text{t}$**
- Coal gangue and other solid waste: 4.5 billion tons, occupying 15000 hectares lands (2009 data)

■ Water Recycling

- Current recycle rate of coal mine water: **22%**

Problem 3

Extensive Water Consumption in the Coal Power Sector

Industrial cooling
loss 3%

Ash removing
10-45%

Cooling tower 40%-
50%

Steam loss 2-4% of the
boiler evaporation

Water treatment
1%-3%

Staff living water
emergency use loss
2-4%

Problem 3 (Continued)

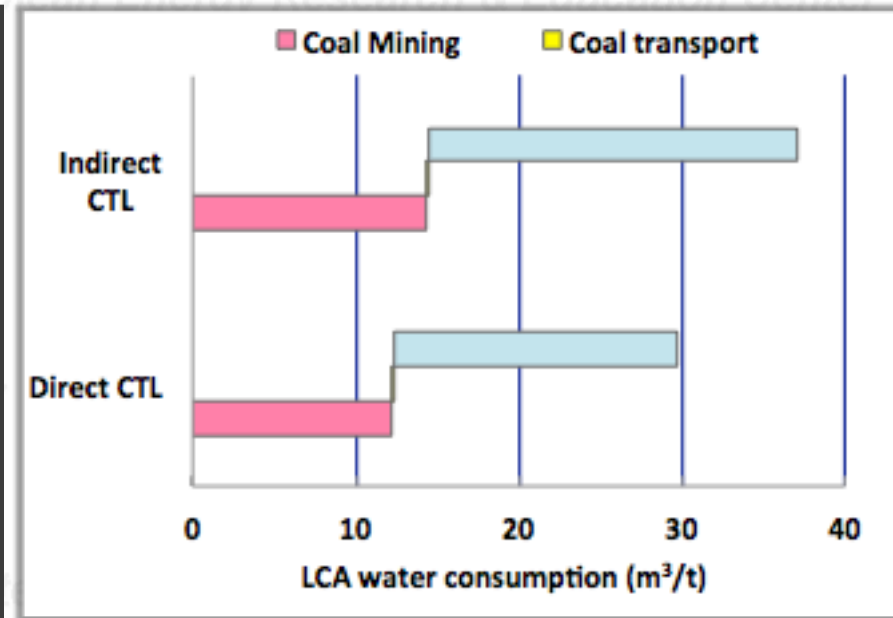

Extensive Water Consumption in the Coal Power Sector

Problem 4

Expected Increase in Water Consumption in the Future

1. Increasing demand for energy
2. Possible boost of coal-to-liquids or coal-to-chemicals industry due to increasing dependence on oil import and lack of security
3. Possible requirements for coal power plants to install CO₂ capture utilities, which would double the water consumption of a power plant

Constraint for Future Development

- In November 2010, the State Council announced the **strictest ever** policy about water resources management, according to which the **industrial water consumption** will **drop** in 2020 and 2030 compared with 2008 level.
- Considering fast development of the coal industry China, demand for **water by the coal sector** will also **increase** in a business-as-usual scenario.

State Council Plan for water consumption in 2020/2030

Year	GDP (¥ billion)	IAV (¥ billion)	IAV/GDP (%)	Water use for ¥ 10,000 GDP ^[1] (m ³)	Water use for ¥ 10,000 IAV ^[2] (m ³)	TWU ^[3] (km ³)	IWU ^[4] (km ³)
2008	30,067	12,911	42.9	231.8	130.3	584	168
2020	55,833	19,542	35.0	120	65	670	127
2030	100,000	30,000	30.0	70	40	700	120

[1] GDP: gross domestic production

[2] IAV: industrial added value

[3] TWU: total water use

[4] IWU: industrial water use

Scenario Analysis on the Industrial Water Use

Industrial water use in four scenarios by 2020 and 2030

- Scenario 1 (S1) serves as a BAU mode, taking no consideration of policies changes and technology improvement
- Scenario 2 (S2) considers impacts of technology improvement
- Scenario 3 (S3) considers impacts of policies changes
- Scenario 4 (S4) considers both technology improvement and policy changes

Technical Means - An Instance: Air Cooling

Technical Means - An Instance: Coal Washing

Steam-coal preparation

The sulfur content of coal is reduced, and the electricity consumption of flue gas desulfurization is reduced 0.718

The efficiency of coal power generation increases, and the coal consumption is reduced 55.8

Transport of the washed steam-coal

The steam-coal demand decreases

The transported amount of steam-coal decreases

The coal mining production decreases

The energy consumption for coal transport is reduced 1.87

The energy consumption for coal mining is reduced 0.61

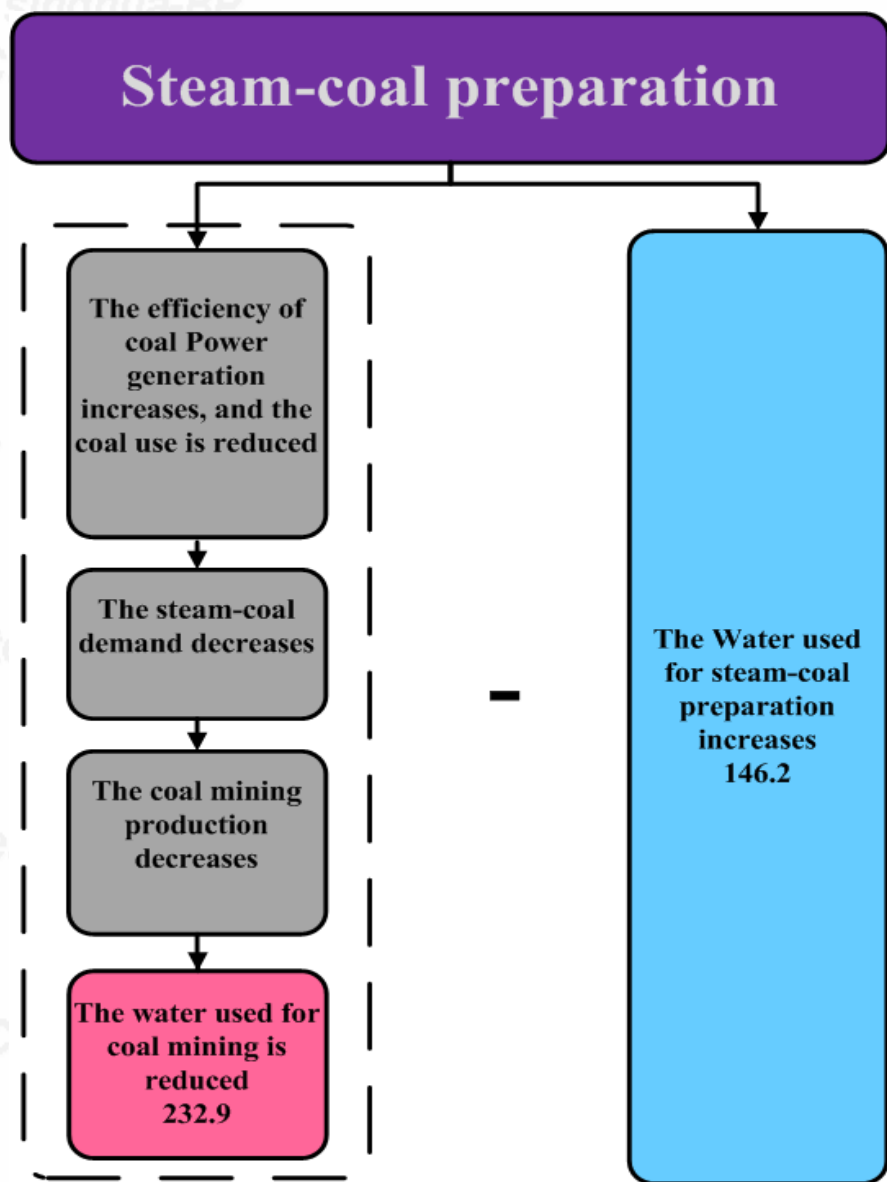

The energy consumption for steam-coal preparation increases 1.27

The net energy saving amount equals to 8.2% of the total energy consumption of the coal supply chain in 2008

Net energy saving amount
57.73

Unit: Mtce

Technical Means - An Instance: Coal Washing

**Net water
saving
amount**
86.7

Based on the data of 2008, China
Unit: million cubic meters

- **0.1%** of the total water use of the coal sector in 2008
- **0.062%** of the industrial water use in 2008

Policy Means: Systematic Design and Planning

• What?

• Coal, electricity, chemicals, SNG, ...

• Where?

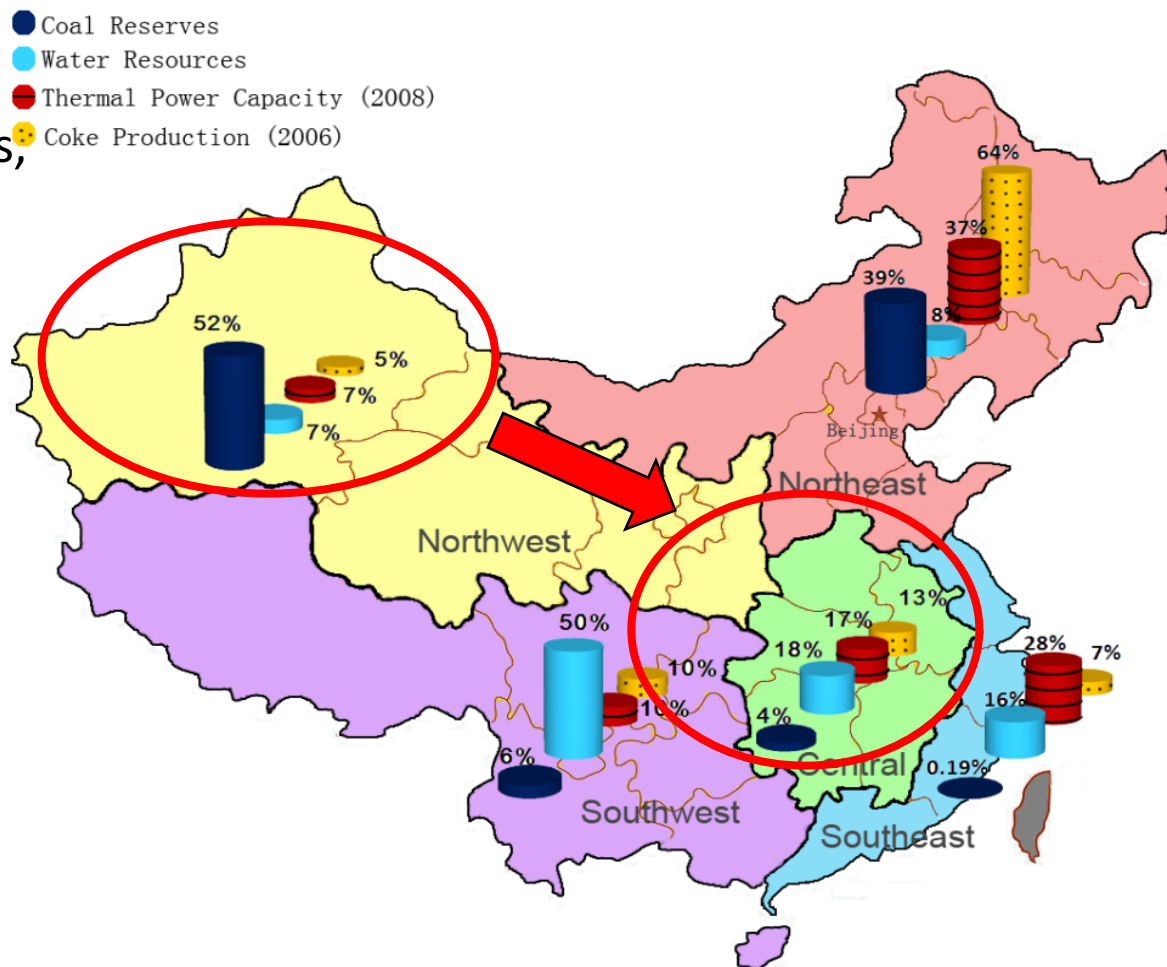

• Location of coal mines, conversion plants

• How?

• Railway, road, pipeline, ...

• When?

• Timing of expansion

Conclusions

- Water issues are neither global nor national, but regional ones
- Mismatch of coal reserves, water resources, and energy demand is the top challenge
- Less-advanced and inefficient utilization of water resources exist in most parts of the coal supply chain in China
- Severe constraint on water consumption for industrial sectors is foreseeable in the near-term futures
- A BAU mode cannot meet the target on water consumption, technical and policy changes are the way out
